COMPANY PRESENTATION

Kendeil is an italian factory with 30 years of experience in manufacturing high quality large can aluminium electrolytic capacitors.

Actual production range spreads from large can screw terminal type capacitors with high end performances to snap in terminal type capacitors mainly used on pcb boards, and to the motor start type for alternate current applications.

A continuous improvement in building technology and automatic computerized machines gives the company a leading role in the market of electronics components, along with competitive priced products and reliability performances.

Also the flexibility of its structure is able to meet any custom design requirement.

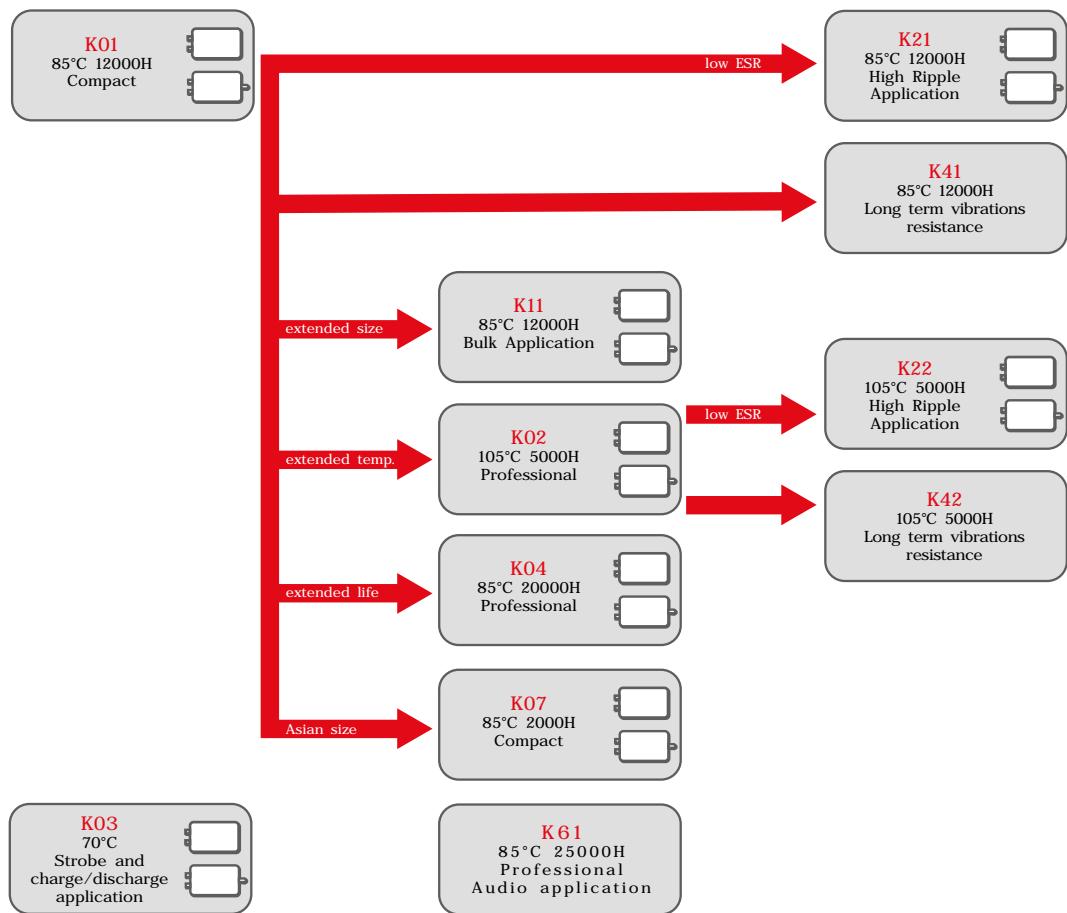

All capacitors are international standards compliant (CECC, DIN, IEC) and the recent achieved Quality Certification ISO 9001 marks an important milestone on the Kendeil history.

BUILDING AN ELECTROLYTIC CAPACITOR

APPLICATIONS

A capacitor is an electrical component that stores a quantity of electrical charge defined with a linear relationship as:

$$Q = C \times V$$

where: Q = electrical charge [Coulomb]

C = Capacitance [Farad]

V = Voltage [Volt]

Usually values are indicated in a smaller unit called micro Farad [μF] that is one million times smaller. An aluminium electrolytic capacitor is composed of one anode of aluminium foil (or one aluminium foil anode) having a dielectric oxidation on its surface, with semiconductor characteristics to prevent the current flow in one direction, and another aluminium foil cathode. There is also an electrolyte impregnated paper layer positioned between the anode and the cathode in order to avoid short circuits. Both the aluminium foils have been etched to obtain active surfaces, increasing their effective area. Aluminium tabs are then connected to the two foils to act as terminals. When in use the impregnated section is then closed inside an suitable case and sealed with a deck. The matching of thin dielectric and a large surface area allows to create capacitors with exceptional high capacitance per volume.

European (CECC) and International standards (IEC) have classified the capacitors in two categories. Electrolytic capacitors for high reliability applications (Long Life Grade): in addition of the possible over anodization (the difference between forming voltage and operating voltage) must generally satisfy high endurance requirements and a careful selection on materials is needed.

Such efforts are not required for capacitors standard version used for less severe reliability (General Purpose Grade).

The whole manufacturing process requested to build a Kendeil electrolytic capacitor could be reasonably split into the following phases:

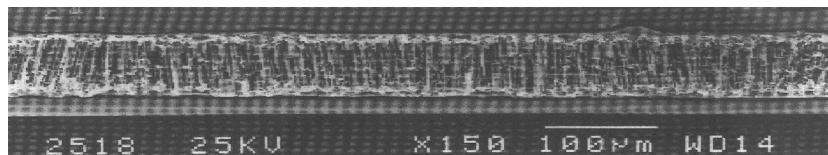

- * Etching
- * Winding
- * Impregnation
- * Sealing
- * Ageing
- * Production Inspections

ETCHING

Plates or electrodes are made of high purity, very thin aluminium foil (0.05 to 0.1 mm thickness). To get the maximum capacitance for a given electrode surface area, an electrochemical process called "etching" is used to dissolve metal and increase the surface area of the foil in the form of a dense network of microscopic channels.

The etching process consists of continuously running aluminium foil through a chloride solution with an AC, DC or AC/DC voltage applied between the etch solution and aluminium foil.

The increase in surface area is referred to as foil gain and can be increased as much as 100 times for foil being used in low voltage capacitor applications and 20 to 25 times for higher voltage applications. The dielectric of the aluminium electrolytic capacitor is composed of a thin layer of aluminium oxide (Al_2O_3) which "forms" on the surface of the etched aluminium foil during a process called "formation."

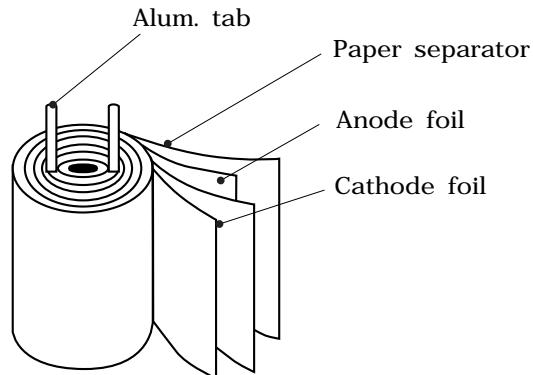

MICROGRAPHS VIEW OF ETCHED ALUMINIUM FOIL

Since capacitance is inversely proportional to the dielectric thickness and this is proportional to the forming voltage, the following relation is applicable:

$$\text{Capacitance} \times \text{Forming Voltage} = \text{Constant}$$

This is true for high voltage foils with a relatively coarse etch structure. However, for foils with extremely fine structures, the process to convert aluminium to aluminium oxide has a significant smoothing effect on the structure that might be described by a non-linear relationship.

WINDING

THE CAPACITOR ELEMENT

Each capacitor contains two foils, the positive foil is called the ANODE and the negative is called the CATHODE. Both foils, along with a separator paper are rolled into a cylinder.

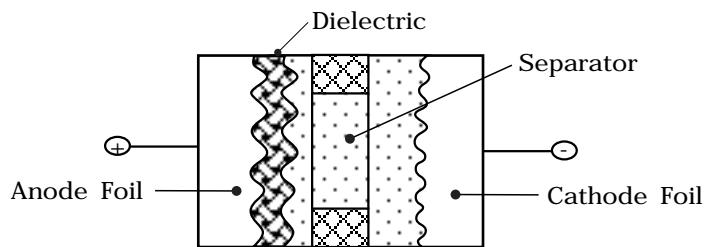

The separator paper prevents anode and cathode foils from coming into contact with each other and shorting. As part of a highly automated winding process, aluminium tabs are attached to the anode and cathode foils. This completed assembly of etched and formed foil, together with separator paper and attached tabs is called the capacitor ELEMENT.

IMPREGNATION

The method of impregnation requires the winding element to be immersed into the electrolyte by either a vacuum/pressure cycle with or without applied heat or by simple absorption.

The electrolyte contains a solvent such as ethylene glycol and a solute such as ammonium borate.

Should the dielectric film be damaged, the presence of the electrolyte will allow the capacitor to heal itself by forming more oxide. By selecting different electrolytes, the capacitor characteristics such as operating temperature range, frequency response, shelf life and load life could be improved.

The cross section for a typical element

SEALING

After impregnation phase, the element is sealed into an aluminium can. Sealing deck materials may be rubber/bakelite or phenolic plastic.

AGEING

Before being sleeved and packed the capacitor is aged and tested, this being the final process of the production chain, usually called "ageing". A voltage greater than the rated voltage is then applied at very high temperatures. The purpose is to reform or to repair any oxide film which may have been damaged during the slitting, winding and assembly processes, thus reducing the leakage current to an acceptable low level.

PRODUCTION INSPECTIONS

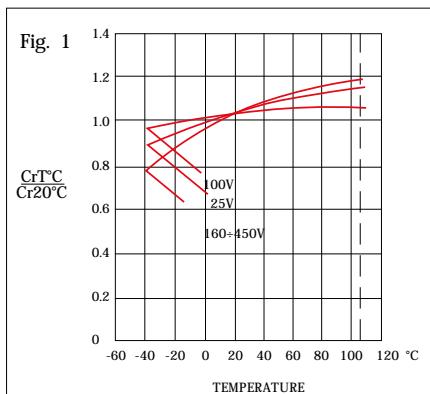

After ageing, capacitors are 100% tested. All electrical requirements are checked using highly advanced automated test equipment and any rejects are removed. Capacitors are also visually inspected, and only capacitors passing both tests are accepted for packaging.

ELECTRICAL CHARACTERISTICS

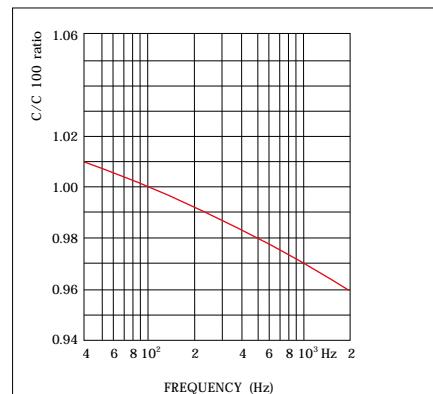

RATED CAPACITANCE

The rated capacitance, defined at 100 Hz and 20°C, is the capacitance of an equivalent circuit having capacitance and resistance series connected. The value is indicated on the external sleeve, specified in micro Farads [μF]. Typical capacitance drift versus temperature and frequency, see below.

CAPACITANCE DRIFT VERSUS TEMPERATURE

CAPACITANCE VERSUS FREQUENCY

RATED VOLTAGE (V_r)

The rated voltage is the value of voltage that could be applied continuously within the operating temperature range of capacitors. When using a capacitor with AC voltage superimposed on a DC voltage, care should be taken such that the peak value of AC voltage plus the DC voltage does not exceed the rated voltage.

Reverse polarization shall not exceed two times VDC value.

When capacitors are series connected, the voltage distribution across the series may not be the same. This is due to normal DC leakage distribution and should be considered in the design process either using a higher rated voltage capacitor or using balancing resistors in parallel with each series capacitor.

SURGE VOLTAGE (V_p)

The surge voltage is the maximum overvoltage including DC, peak AC and transients to which the capacitor could be subjected for short periods of time (not more than 30 seconds in any 5 minute period).

Depending on applicable specifications, this test is usually performed at maximum operative temperature. A current limiting resistor of 1000 ohm should be used.

Charge is held for 30 seconds for 1000 cycles, then the capacitor is allowed to discharge without load for 5 minutes. Rated and surge voltage values for Kendeil capacitors are listed in following table, where a different relation is applied depending on rated value (V_r).

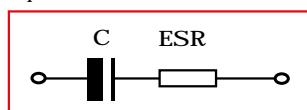

| | $V_p = 1.15 V_r$ | | | | | | | | | | $V_p = 1.10 V_r$ | | | $V_p = 1.05 V_r$ | |
|-------------------|------------------|----|----|----|----|----|-----|-----|-----|-----|------------------|-----|-----|------------------|-----|
| RATED VOLTAGE [V] | 16 | 25 | 40 | 50 | 63 | 75 | 100 | 160 | 200 | 250 | 350 | 400 | 450 | 500 | 550 |
| SURGE VOLTAGE [V] | 18 | 29 | 46 | 57 | 72 | 86 | 115 | 184 | 230 | 287 | 385 | 440 | 495 | 525 | 578 |

EQUIVALENT SERIES RESISTANCE (ESR)

The equivalent series resistance is the resistance that a capacitor has to the alternating current flow. Various resistive components such as: electrolyte, paper foil, aluminium foil, tabs, and others determine the total ESR value. It is measured at 100 Hz and 20°C. It is related and dependant on temperature and frequency and generally when either these factors increase, a reduction in ESR results.

The construction technology of Kendeil capacitors reduces significantly the ESR value.

Equivalent Standard Circuit

| |
|---|
| $ESR = R_1 + R_2 + R_3$ |
| R_1 = Resistance of aluminium oxide thickness |
| R_2 = Resistance of electrolyte, spacer |
| R_3 = Resistance due to materials: foil lenght, tabs, terminations contact resistance |

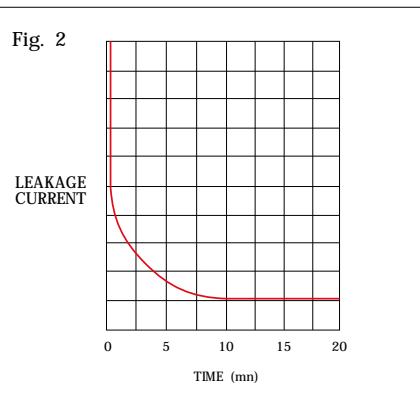

LEAKAGE CURRENT (IL)

Measured at 20°C after 5 minutes under rated voltage.

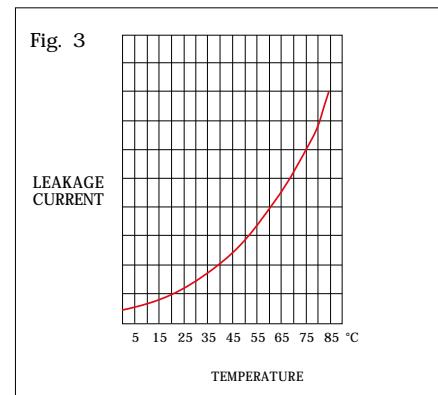

It is the current flowing through the insulation resistance when a direct current is applied to the capacitor. After charging a capacitor to a set voltage we obtain, initially, a high current flow which decreases rapidly until a constant very small value is reached, the final leakage current. The leakage current value increases both with voltage and temperature. After a long storage period, the leakage current value can be exceeding the rated value and before the output measurement reanodization is necessary.

For typical leakage current versus time and temperature, see Fig. 2-3.

IL DRIFT VERSUS TIME

IL DRIFT VERSUS TEMPERATURE

DISSIPATION FACTOR ($\tan \delta$)

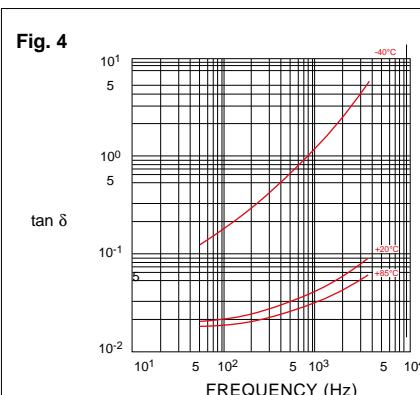

Dissipation factor or loss angle tangent ($\tan \delta$) is a main electrical characteristic of an electrolyte capacitor, a measure of the deviation from an ideal capacitance value. Relationship is included in the following formula:

$$\tan \delta = 2 \pi f C ESR$$

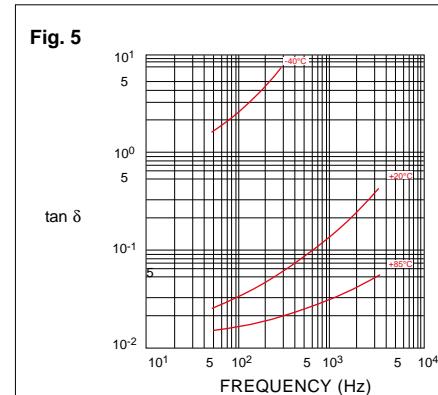

where f = frequency C = rated capacitance

Maximum values in the datasheets have been indicated at 100Hz and 20°C. Drift versus frequency as Fig. 4-5.

$\tan \delta$ DRIFT VERSUS FREQUENCY
LOW VOLTAGE (100 V_r d.c.)

$\tan \delta$ DRIFT VERSUS FREQUENCY
HIGH VOLTAGE (> 100 V_r d.c.)

INDUCTANCE

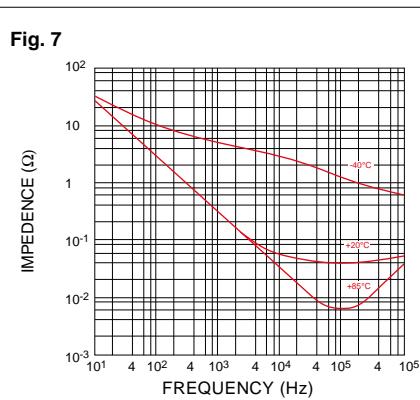

Some inductance is present in aluminium electrolytic capacitors, but values are usually less than few tens of nH.

IMPEDANCE (Z)

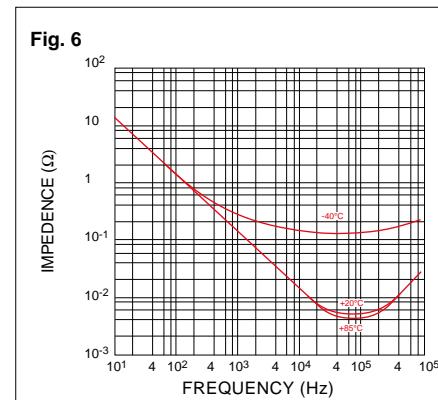

$$Z = \sqrt{ESR^2 + (X_L - X_C)^2}$$

Impedance is dominated by the capacitive reactance (X_C) at low frequencies and by the inductive reactance (X_L) at high frequencies. At the point of series resonance $Z=ESR$. Typical impedance drift versus frequency, see Fig. 6-7.

**Z DRIFT VERSUS FREQUENCY
HIGH VOLTAGE (> 100 V_r d.c.)**

**Z DRIFT VERSUS FREQUENCY
LOW VOLTAGE (100 V_r d.c.)**

RIPPLE CURRENT (I_r)

It is defined as the superimposed alternated ripple current (sinusoidal alternating current at 100 Hz). It depends mostly on an allowable temperature rise within a capacitor section due to the power relation formula: $I^2 \times R$. Heating occurs, due to an alternating current flowing through the equivalent series resistance of capacitor. Actual power must be considered when defining ripple current capability. The thermal gradient of an aluminium foil capacitor in an aluminium can is 10^{-3} Watt/cm²/°C. Since the ripple current raises the temperature of the capacitor it has a significant effect on the operational life of the component. A diagram of useful life specifies life under given operating conditions of different temperatures values and ripple current values.

SHELF LIFE (Voltage free storage)

Capacitors generally can be stored at temperatures up to 50°C without any reduction of their reliability. Overall characteristics such as capacitance, ESR and impedance should show good performance with no sensitive changes while the leakage current will exhibit a slow drift upwards.

In practical use, we experienced the following scheme meaningful for voltage rated classes of capacitors:

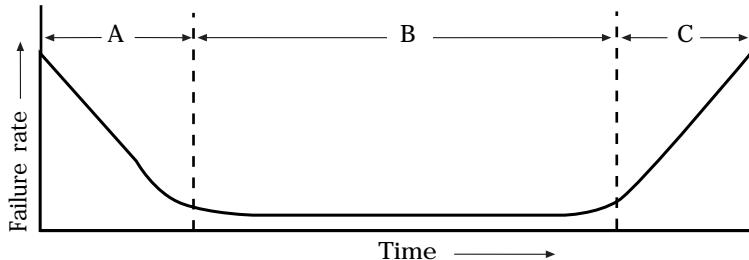

| THREE YEARS | TWO YEARS |
|-------------|-----------|
| 100V DC | > 100V DC |

After an extended storage period, the leakage current value may exceed the rated value and, before the output measurement, a reanodization process is required.

It could be realized by applying the rated voltage at room temperature for one hour.

In any case it is advisable to use a maximum charging current of 5mA or twice typical value specified for each series.

With the advancements in aluminium electrolytic capacitor technology, the capacitors used in equipments must have a very long life characteristics and must operate even under severe conditions. A careful choice of a capacitor for a particular application and an adequate installation in the circuit will assure a good service life. In any case any component will eventually fail, usually this occurs due to a slow, steady drift of parameters called wear-out; sometimes there is a sharp change in capacitor properties also called catastrophic failure. In general terms the failure rate of aluminium electrolytic capacitors follows a bathtub curve with time as shown here.

THE BATHTUB CURVE
Three different areas are defined where capacitor life could be observed: A, B, C.

(A) Initial Failure Period

This is the period during which failures are caused by deficiencies in design, structure, manufacturing processes or severe applications. Such failures occur soon after the components are exposed to circuit conditions. In aluminium electrolytic capacitors, these failures are either corrected through aging or found during the 100% inspection processes and do not reach the field.

Initial failures due to a bad application of the capacitor such as inappropriate ambient conditions, over voltage, reverse voltage or excessive ripple current can be avoided with an adequate circuit design and careful installation.

(B) Random Failure Period (USEFUL LIFE)

Here the failure rate is low. During this period a constant failure rate is shown. These failures are not related to operating time but to application conditions. This period of useful life is normally calculated with a confidence level of 60%.

(C) Wear-Out Failure Period

In this period the properties of a component gradually deteriorate and the failure rate increases with time. Aluminium electrolytic capacitors end their useful life during this period. Criteria for judging failures varies with application design factors.

Reliability represents this measure of the expected failure rate during the useful life of the capacitor. Failure rate is defined as the number of components failing during a unit working time. It is expressed by following formula:

1 fit = 1 10^{-9} /hours (failure in time) also indicated as percentage of failures in 1000 hours.

$$\lambda = \text{number of failures} / (\text{number of components tested} \times \text{working time})$$

MTBF (Mean Time Before Failure) could be calculated according to failure rate following the relationship:

$$\text{MTBF} = 1/\lambda$$

This value defines the failure frequency occurring on a large number of components inside an equipment, therefore is not suitable to predict failure on one single capacitor. Statistical calculations should be used instead. It is helpful as a design tool to determinate reliability features for components and complex systems.

EXAMPLE

A batch of 10000 capacitor tested, for 40000 operating hours, finding 4 failures.
 $\lambda = 4/10000 \times 1/40000 \text{ h} = 10 \text{ fit} = 0.001\% /1000 \text{ hours}$

The failure rate calculation is derived from endurance tests at specified temperatures, taking into account all measurable and non-measurable defects arised. Kind of measurable defects are meant for each type of capacitor endurance test point. While non-measurable defects are meant to be open and short circuit, safety valve break or electrolyte leakage. Ripple current and ambient temperature contribute to the internal temperature rise of the capacitor, so affecting its useful life. In general, every 10°C reduction in temperature carries a multiplier factor of two times the life value.

USEFUL LIFE

The typical useful life represents a period of time until the end of life of the capacitor. The end is caused by different incidents (or different failure modes) such as the following:

MECHANICAL FAILURES

operation of safety vent due to overpressure, splitting of PVC sleeve and damaged insulation, unusable terminals, external short circuiting of terminals due to spilling of electrolyte.

OVER FAILURES

when a short or open circuit occurs.

ELECTRICAL CHARACTERISTICS FAILURES

In a group of capacitors considered to have reached the end when 3% of them have failed, useful life is influenced by following failure criteria:

- a) ESR > 3 times initial value
- b) impedance > 3 times initial value
- c) capacitance value change of greater than 30%
- d) leakage current over initial limit.

In some cases, it is possible that even larger values of the above indicated could be applied without leading to failure, but generally capacitors tested in the laboratory at Kendeil show standard behaviour around these limits. Obviously, when operating at lower voltages together with moderate temperature as well as lower values of current, the final life expectation should be better.

When an adequate cooling system has been provided, the overall performance is substantially better and the life of the capacitor is improved.

In normal conditions, statistics are produced after extensive endurance tests compliant to standard specifications. Depending of the type of capacitor, endurance tests have been undertaken over different lengths of time using capacitors coming from production batches. Data is collected and results summarized, so we have generated wide information displayed graphically for each model, which can be seen on each product datasheet. The useful lifetime regarding the ambient temperature is given by following practical formula:

$$\text{USEFUL LIFETIME} = L_{\text{OPMAX}} \times 2^{(T_{\text{max}}+10-T_c)/10}$$

Where:

USEFUL LIFETIME expressed in hours

L_{OPMAX} = Lifetime at max rated operating temperature (eg: 10000 hs at 85°C)

T_{max} = Actual operating temperature of the capacitors (eg: 85°C for K01 type)

T_c = Temperature of the core = internal hot spot of the capacitor (°C)

Example:

For a capacitor that has an internal core temperature of 55,43 °C, at ambient temperature of 45 °C, the life, expected calculation gives the following:

USERFUL LIFETIME

$$= 10000 \times 2^{(85+10-55.43)/10}$$

$$= 10000 \times 2^{3.956}$$

$$= 155194 \text{ hours}$$

NOTE

Applicable temperature range is the temperature depending on the capacitor type characteristics, usually situated in the operating range of -40°C to +85°C or 105°C. Typically, each 10°C step carries a reduction factor of 2 times the lifetime value.

Useful life is also determined by ripple current.

It is advisable not to apply a ripple current exceeding the max ripple current allowed as this will shorten capacitor life and may result in opening of the vent or catastrophic failure.

It often happens that heating due to ripple current is even more severe than ambient temperature stress.

GUIDELINES FOR ALUMINIUM ELECTROLYTIC CAPACITORS

- POLARITY
- CHARGE - DISCHARGE APPLICATIONS
- INSULATION
- OPERATING TEMPERATURE
- CLIMATIC CONDITIONS
- MECHANICAL STRESS
- SOLDERING
- CLEANING
- STORAGE
- SAFETY
- BALANCING RESISTORS
- FLAMMABILITY

• POLARITY

In DC applications polarity is required; if polarity is reversed, the circuit life will be shortened or the capacitor may be damaged. Generally, an intermittent reverse voltage of 1V DC is allowed. If during operation, it is possible that polarity could be reversed or unknown, extensive use of a bipolar capacitor is required.

• CHARGE - DISCHARGE APPLICATIONS

Kendeil aluminium electrolytic capacitors are suitable for circuits in which a charge and discharge cycle is requested. The frequent cycles due to a charge or discharge operation could take some drop of capacitance value. In general one million of switching with rated voltage one cycle for second a time costant of 0.1 carries an overall capacitance decrease less than 10%.

• INSULATION

In general all aluminium electrolytic capacitors are covered with a PVC sleeve, that is also used for marking. The aluminium can is not insulated from the cathode, so when the internal element needs to be electrically insulated from the can, capacitors specially designed for insulation requirements should be used.

• OPERATING TEMPERATURE

A capacitor should be chosen with a maximum specified temperature greater than the operating temperature of the application; this will increase the capacitor useful lifetime.

• CLIMATIC CONDITIONS

All Kendeil capacitors maintain good behaviour under any climatic conditions when operating conditions are within the design specifications limits of each product type.

Since each capacitor is hermetically sealed, the wet element inside impregnated with electrolyte will not be exposed to external conditions such as high pressure or vacuum.

Furthermore, all electrical parameters such as impedance, leakage current, ESR and capacitance, will not be significantly changed by these external conditions.

Temperature range of Kendeil electrolytic capacitors (IEC 68-1):

| Capacitor type | IEC 68-1 code | Temperature Range |
|-------------------------------|---------------|-------------------|
| K01-K04-K07-K11-K21-K41 screw | GP | -40°C + 85°C |
| K02-K22-K42 screw | GM | -40°C + 105°C |
| K05-K15-K25-K55 snap in | GM | -40°C + 105°C |
| K06-K16-K26 snap in | GP | -40°C + 85°C |
| K13 fast on (lug) | HS | -25°C + 75°C |

AIR PRESSURE

When operating at low values of external air pressure, there could also be an increase in the pressure inside the case. When an external vacuum exists, the pressure inside the capacitor could rise up to 1 bar. In these circumstances the internal vapour loss becomes greater resulting in an overall reduction in expected life.

ALTITUDE

When in extreme altitude situations, consideration must be given to the shortening of capacitor life due to the reduced air density, preventing heat from being adequately dissipated from the external surfaces of the capacitor leading to an increase in internal temperatures.

• MECHANICAL STRESS

If excessive force is applied to terminations, they may break or their connections with the inside element may be badly affected. The distance between terminations holes on the circuit board should be the same as the spacing between terminations on the capacitor.

SCREW TERMINAL

Excessive torque force applied in tightening the screws into terminals will result in stripping the threads and possibly increasing the contact resistance. On the other hand, if screws are not enough tightened enough, the high contact resistance will cause localized heating at terminals plus an early failure of the capacitor.

SNAP IN

Improper insertion into the circuit boards may break the terminals or impair their electrical connections with the internal elements. When provided, blank terminals of a multi-terminal capacitor should be considered to be at the same potential as the electrolyte, or cathode, and should therefore be isolated from the circuit.

APPLICATION OF TORQUE TO ALUMINIUM THREADS

Please note the max applicable torque strength to screw type capacitors:

With M5 insert screw torque = 2Nm

With M6 insert screw torque = 4Nm

Screw torque strength for stud M8 = 4Nm

Screw torque strength for stud M12 = 8Nm

• SOLDERING

Incorrect soldering may shrink or break the capacitor sleeve. Please read the following information carefully.

- When soldering a printed circuit board (PCB), the soldering temperature should not be excessive while time taken should be short. Otherwise it could have adverse effects on the electrical characteristics and insulating sleeves.
 - During the soldering process, the sleeve may melt or break if it gets in contact with circuit board traces. Try to avoid this problem and do not locate circuit board traces under capacitor body.
 - The sleeves may be melted by solder which migrates up through terminations holes in the circuit board.
 - When soldering adjacent components to the capacitor, preheated lead wires or terminals may tear the capacitor sleeve if they come in contact with it. Therefore, capacitors are to be mounted carefully so that adjacent components terminations do not come into contact, particularly when mounting on through-hole circuit boards.
- For snap-in type capacitors: our products are in line with IEC standard and it means a resistance to soldering heat defined for solder bath method 260°C 10 s.

• CLEANING

Aluminium can be aggressively attacked by halide ions, particularly by chloride ions. Even small amounts of chloride ions inside the capacitor will cause corrosion which contributes to rapid capacitance drop and venting. Therefore, the prevention of chloride contamination is the most important check point for quality control in production. Solvent proof capacitors are required when chlorinated hydrocarbons are used for cleaning. If aluminium electrolytic capacitors without the solvent-proof construction are present on the circuit board, alcohol based solvents are recommended for cleaning.

In this case, solvents such as methanol, ethanol, propanol and isopropanol should be used. Normal tests show that any detrimental effect is eliminated. An alkaline detergent may damage the aluminium metal and marking. Aqueous cleaning methods in conjunction with saponification are commonly used. However it is advisable to dry immediately with hot air, which is best achieved at 85°C for few minutes.

• STORAGE

After having a capacitor exposed to high temperatures such as direct sunlight or heating elements, the capacitor life may be adversely affected. Also when capacitors have been stored under humid conditions for a long period of time, humidity will cause terminals to oxidize. Therefore it is highly recommended they should be stored at room temperature, in a dry place, out of direct sunlight.

A voltage treatment process should be applied after some years storage period.

When capacitors have been stored above room temperature, the anode foil may react with the electrolyte causing increased leakage current values. Application of normal voltages to these capacitors may result in higher leakage current values, but in most cases, they will return to normal levels in short time.

However on occasion it is possible that a certain amount of gas will be generated which might cause the safety vent to open. Capacitors that have been stored for long time should be subjected to a voltage reforming process which will regenerate internal dielectric layers.

• SAFETY

When an escape of electrolyte has occurred, wash the affected area with hot water. Use rubber gloves to avoid skin contact. Any contact with eyes should be immediately irrigated with water and medical advise is sought. Kendeil electrolyte blends do not contain materials currently listed as carinogetic or mutagenic such as polychlorinated biphenyls (PCB) or dimethylformamide (DMF). No Butyrolactone used as solvent.

Under exposure to electrolyte skin could become dry. Other irritations or effects may be caused to the mucous membranes particularly eyes, where conjunctivitis may result.

• BALANCING RESISTORS in series and parallel connections

The following explanation is given for a typical connection scheme, when two capacitors have been connected in series, this is a brief approach answering to the question "How much could be the maximum voltage applied to a capacitor?"

If we have two capacitors of 400V rated with $\pm 20\%$ tolerance range each.

Total voltage applied is 800V (V_{circuit}), in the best situation each capacitor is well balanced.

Anyway the maximum and minimum values due to the tolerance range is then put in the formula.

It is easy to calculate the maximum exposing voltage to whom the minimum capacitor could be applied.

$$V_{MINCAP} = V_{circuit} \times (1+20\%) / (\text{MIN}_{tolerance} + \text{MAX}_{tolerance})$$

Using the values from example, we have: $V_{MINCAP} = 800 \times 1.2 / (0.8 + 1.2) = 480V$

This is the real maximum voltage value applied to the capacitor in a serial connection. It is strongly recommended to use a resistor that would share the over-voltage.

In the practical field of designing these kind of circuits, we have found that a good balancing system could be obtained using the following formula in which only the capacitor value is required.

We assume that a current from 15 to 20 times the leakage current value would be flowing in the resistor, therefore a simple relationship could be applied:

$$\text{Balancing Resistor [k}\Omega\text{]} = 60,000 / \text{Capacitance [\mu F]}$$

The resistor should have very good characteristic, usually with tolerance range of $\pm 5\%$ but better tolerance range is preferred when dealing with high transients and a top level performance is required.

When designing high current applications, a parallel configuration should be preferred.

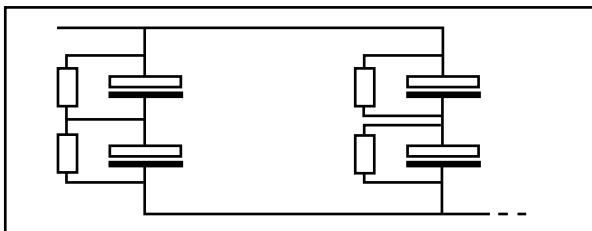

PRACTICAL TABLE

| Capacitor | Balancing Resistor |
|---------------|--------------------|
| 470 μF | 127 k Ω |
| 680 μF | 88 k Ω |
| 1000 μF | 60 k Ω |
| 2200 μF | 27 k Ω |
| 4700 μF | 13 k Ω |
| 6800 μF | 9 k Ω |
| 10000 μF | 6 k Ω |

CONFIGURATION SCHEMES

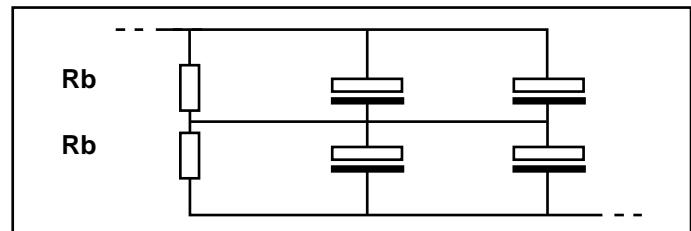

Two ways of connecting balancing resistors are implemented in the industry, depending on design and experience. Both of them have important features that must be borne in mind for the appropriate performances required.

Single balancing resistor

- (+) Plus features
When one capacitor fails, the adjacent capacitor will probably fail too, but the other capacitor will remain undamaged.
- (-) Minus features
There are many resistors to be placed in the circuit.

Two parallel resistors

- (+) Plus features
A better balancing system is achieved with "the most parallel capacitors used".
The total leakage current as the sum of the single branches components gives a very good balancing system. This configuration needs only two resistors and since the delta LC would be a very small value, it could be realized also without any resistor.
- (-) Minus features
When one capacitor fails, the parallel branch in which it is operating will also fail as the total voltage will be applied under operating voltage conditions.

• FLAMMABILITY

Some component parts of a capacitor are suitable to burn depending on ambient temperature and adjacent elements, being made of plastic, PVC or other, even when classified as non flammable material.

In the table you find the main materials with self extinguish capability under normal circumstances:

| PART | USE | MATERIAL | |
|-------------|--|-------------------------------------|---|
| DECK | for screw type terminal for snap-in type terminal | Phenolic Rubber bakelite coupled | No ignition non flammable No ignition non flammable |
| CAN | for Motor Start type K13 ONLY | Polycarbonate (plastic) | Ignition not self extinguishing |
| SLEEVE | all screw snap-in type | PVC or PET | No ignition |
| VENT PLUG | for screw type terminal only | Silicone | Ignition non flammable |
| ELECTROLYTE | all internal wound elements in each capacitor | Glycol based (*) | not self extinguishing non flammable (*1) flash point 110°C higher then rated 85° or 105° class |

(*) NOTE FOR ELECTROLYTE

Kendel uses glycol based electrolyte through all ranges of products.

The impregnation process is computer controlled with supervisor agent software to assure the correct time and level of electrolyte needed by each single capacitor.

Different kinds of electrolyte blends are being used, especially designed for low voltage, medium voltage and high voltage range.

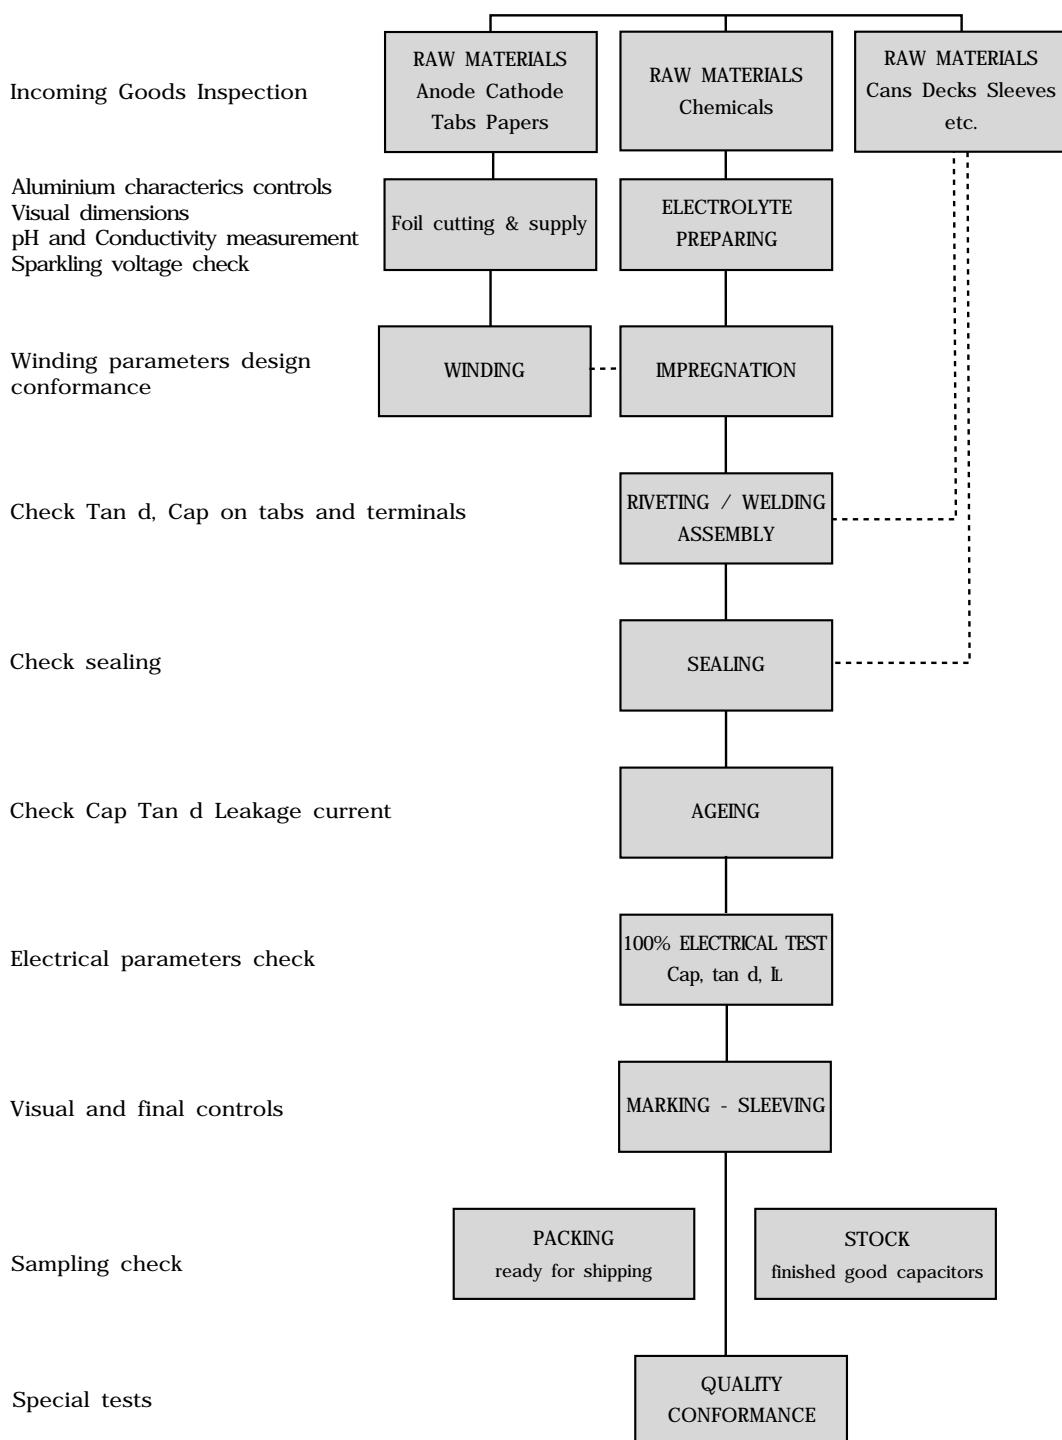

Each production batch is controlled in the internal laboratory to test the specifications of recipes.

| <120V | 120V - 400V | >400V |
|-------------|----------------|--------------|
| LOW VOLTAGE | MEDIUM VOLTAGE | HIGH VOLTAGE |

(*1) Flash point is defined as the lowest temperature at which a flame is ignited.

In our case, no flammable behaviour is possible as the rated class of capacitors are under that value.

MANUFACTURING CONTROL FLOW

- Surge-proof capacitor in aluminium can with insulation sleeve.
- Poles brought out to heavy duty screw terminals.
- To be mounted with ring clips or with threaded stud
- Very high CV for unit volume with low ESR.
- High ripple current.
- Excellent electricals data in small dimensions case size.

APPLICATIONS

Designed for professional power electronics. Switch mode power supplies, converters, filtering devices.

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

USEFUL LIFE K01

The graphs shows a typical trend of the standard capacitor load life.
For a more accurate calculation of the load life for a specific capacitor, please use our calculator on the website www.kendeil.com or enquiry our technical service.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- Poles brought out to heavy duty screw terminals.
- To be mounted with ring clips or with threaded stud
- Very high CV for unit volume with low ESR and impedance.
- High ripple current capability. Extended temperature range.
- High level reliability with outstanding high frequency characteristics.

APPLICATIONS

High professional power supplies. Switch power supplies, power converters, filtering devices, motor drive.

USEFUL LIFE K02

The graphs shows a typical trend of the standard capacitor load life.
For a more accurate calculation of the load life for a specific capacitor, please use our calculator on the website www.kendeil.com or enquiry our technical service.

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- Heavy charge/discharge duty.
- To be mounted with ring clips or with threaded stud.

APPLICATIONS

Extreme application welding, Strobe applications.

SPECIFICATIONS

| | |
|--|--|
| Temperature Range | Operating: -20°C +70°C Storage : Preferably below +25°C, not exceeding +40°C |
| Rated Voltage Range (V _r) | from 400V to 500V DC |
| Surge Voltage (V _p) | V _p = 1.05 V _r (V _r > = 475V DC) - V _p = 1.10 V _r (V _r > 250V DC) |
| Rated Capacitance Range | from 560 μF to 3300 μF |
| Capacitance Tolerance | ±20% at 100 Hz, 20°C [M class IEC-62] on request: -10% +30% at 100 Hz, 20°C [Q class IEC-62] |
| Leakage Current (I _L) (5 min, 20°C) | max I _L = 0.006 C _r V _r + 4 μA |
| Insulation Resistance | At 100V DC for 1 min is >100 M Ω across insulating sleeve and terminals. |
| Vibration Resistance | Frequency range: 10 Hz to 55 Hz, amplitude 0.75 mm Capacitor length ≤ 143 : max acceleration 10g for 3x2 h Capacitor length > 143 : max acceleration 5g for 3x0.5 h |
| Discharge Life | Test conditions: 10000 times at room temperatures (5-35°C) Charge and Discharge cycles: 30 sec Cap change ≤ 10% tan δ ≤ 150% Leakage current (I _L) < 150% of initial limit Impedance (Z) ≤ 200% |
| Shelf life | After leaving capacitors under no load for 500 hours at 55°C when restored at 20°C meet specifications aside Cap change ≤ ±15% tan δ ≤ 150% Leakage current (I _L) < initial limit |
| Failure percentage | ≤ 1% (during useful life) |
| Failure rate | ≤ 33 fit (33 10 ⁻⁹ /h) (V _r > 160V DC) |
| Self inductance | Approx. 20 nH |
| Reference standards | CECC 30.300 IEC 60384-4 LONG LIFE GRADE |

- Extended life
- Surge-proof capacitor in aluminium can with insulation sleeve.
- To be mounted with ring clips or with threaded stud.
- Designed for high resistances to voltage spikes.

APPLICATIONS

Power supplies, motor drives, welding, energy storage.

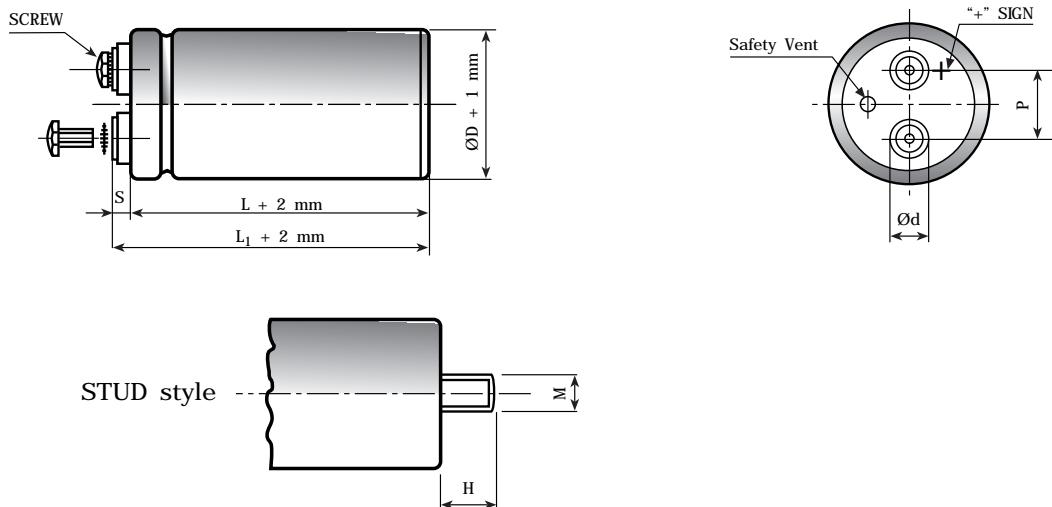

Diagram of dimensions (unit=mm)

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

LOAD LIFE K07

The graphs shows a typical trend of the standard capacitor load life.
For a more accurate calculation of the load life for a specific capacitor, please use our calculator on the website www.kendeil.com or enquiry our technical service.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- To be mounted with ring clips or with threaded stud
- Design optimized for parallel connection and high density of energy

APPLICATIONS

Energy Storage, Bulk.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- To be mounted with ring clips or with threaded stud
- Design optimized for high ripple current applications

APPLICATIONS

Designed for professional application. Switch mode power suppliers, high ripple current converters, motor drives.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- To be mounted with ring clips or with threaded stud
- Design optimized for high ripple current applications

APPLICATIONS

Designed for professional application. Switch mode power suppliers, high ripple current converters, motor drives.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- To be mounted with ring clips or with threaded stud.
- Design optimized for long term vibration stress, traction market.
- Octagonal can shape.

APPLICATIONS

Designed for professional application under high mechanical stress.

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- To be mounted with ring clips or with threaded stud.
- Design optimized for long term vibration stress, traction market.
- Octagonal can shape.

APPLICATIONS

Designed for professional application under high mechanical stress.

SPECIFICATIONS

| | | | | | | | | | |
|--|---|---|-----------------|--------|--------|--------|------|------|-------|
| Temperature Range | Operating: -40°C +105°C Storage : Preferably below +25°C, not exceeding +40°C | [Environmental classification 40/105/56 IEC-68] | | | | | | | |
| Rated Voltage Range (V _r) from 16V to 450V DC | | | | | | | | | |
| Surge Voltage (V _p) | V _p = 1.15 V _r (V _r ≤ 250V DC) V _p = 1.10 V _r (V _r > 250V DC) | | | | | | | | |
| Rated Capacitance Range from 100 μF to 470,000 μF | | | | | | | | | |
| Capacitance Tolerance ±20% at 100 Hz, 20°C [M class IEC-62] on request: -10% +30% at 100 Hz, 20°C [Q class IEC-62] | | | | | | | | | |
| Leakage Current (I _L) (mA, 5 min, 20°C) | max I _L = 0.003 C _r V _r + 4 μA At 85°C max I _L = 0.02 C _r V _r μA | | | | | | | | |
| Ripple current (I _r) | Refer to table at 105°C and 100Hz. For different temperature and frequency multiplier must be used as follows: | | | | | | | | |
| | FREQUENCY | 50Hz | 100Hz | 500 Hz | 1000Hz | >10kHz | | | |
| | MULTIPLIER | 0.8 | 1.0 | 1.2 | 1.3 | 1.5 | | | |
| | AMBIENT TEMP | 35°C | 45°C | 55°C | 65°C | 75°C | 85°C | 95°C | 105°C |
| | MULTIPLIER | 3.0 | 2.80 | 2.60 | 2.40 | 2.20 | 1.80 | 1.5 | 1.0 |
| | Maximum internal temperature | 108°C | | | | | | | 0.5 |
| | Due to the current load capability of the contact elements, the following limits must not be exceeded: | | | | | | | | |
| | CAPACITOR DIAMETER | 35mm | 51mm | 63mm | 76mm | 90mm | | | |
| | Maximum current | 20A | 30A | 40A | 50A | 70A | | | |
| Insulation Resistance | At 100V DC for 1 min is >100 MΩ across insulating sleeve and terminals. | | | | | | | | |
| Vibration Resistance | Frequency range: 10 Hz to 55 Hz, amplitude 0.75 mm Capacitor length ≤ 143 : max acceleration 10g for 3x2 h Capacitor length > 143 : max acceleration 5g for 3x0.5 h | | | | | | | | |
| Life test | After 2,000 hours application of rated voltage at 105°C capacitors meet characteristics aside | | Cap change | ≤ 20% | | | | | |
| | | tan δ | ≤ 200% | | | | | | |
| | | Leakage current (I _L) | < initial limit | | | | | | |
| | | Impedance (Z) | ≤ 200% | | | | | | |
| Shelf life | After leaving capacitors under no load for 500 hours at 105°C, when restored at 20°C meet specifications aside | | Cap change | ≤ ±15% | | | | | |
| | | tan δ | ≤ 150% | | | | | | |
| | | Leakage current (I _L) | < initial limit | | | | | | |
| Useful life | 250000 h at 40°C 15000 h at 85°C 5000 h at 105°C | | | | | | | | |
| Failure percentage | ≤ 1% (during useful life) | | | | | | | | |
| Failure rate | ≤ 40 fit (40 10 ⁻⁹ /h) | | | | | | | | |
| Self inductance | Approx. 20 nH | | | | | | | | |
| Reference standards | CECC 30.300 IEC 60384-4 LONG LIFE GRADE | | | | | | | | |

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

- Surge-proof capacitor in aluminium can with insulation sleeve.
- Extremely linear characteristic between 20Hz to 22KHz
- Design optimized for Audio application.
- No effects of sound compression
- Precisely and realistic dynamic of sound.

APPLICATIONS

Designed for professional application. Linear amplifiers, audio filtering.

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

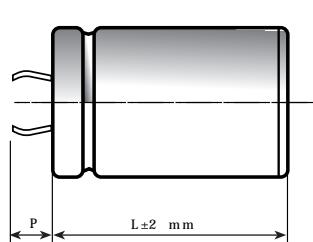

- Surge-proof capacitor in aluminium can with insulation sleeve
- Safety vent at bottom case or aside case.
- Snap in terminals for PCB mounting.
- Very high CV for unit volume with low ESR.
- High ripple current, in small dimensions case size.
- Extended temperature range with outstanding reliability.

APPLICATIONS

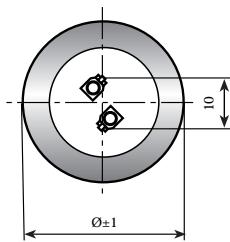

Professional switch mode power supplies. Professional power electronics.

Dimensions in mm.

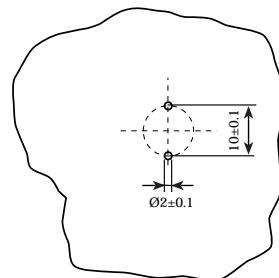

2 PIN CAPACITOR

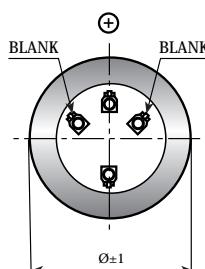

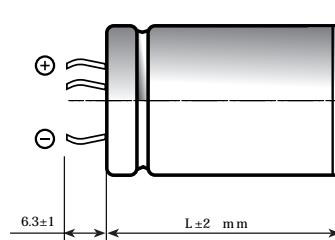

PIN LENGTH
 P 4.5 short pin
 P 6.3 long pin (standard)

- Surge-proof capacitor in aluminium can with insulation sleeve
- Safety vent at bottom case or aside case.
- Snap in terminals for PCB mounting.
- Very high CV for unit volume with low ESR.
- High ripple current, in small dimensions case size.
- Operation up to 105°C permissible..

APPLICATIONS

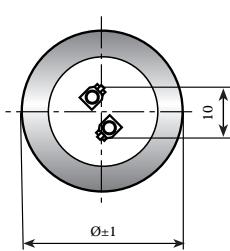

Professional switch mode power supplies. Professional power electronics.

Dimensions in mm.

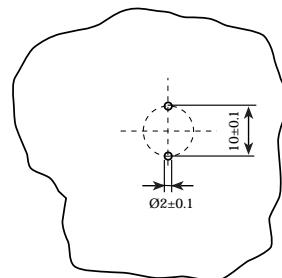

2 PIN CAPACITOR

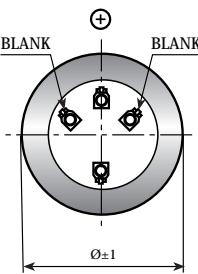

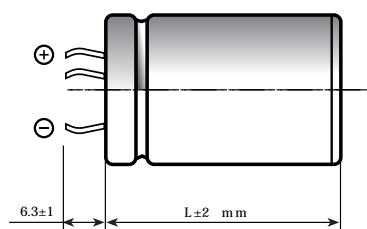

PIN LENGTH
 P 4.5 short pin
 P 6.3 long pin (standard)

SPECIFICATIONS

| | | | | | | |
|---|--|---|-------|--------|--------|--------|
| Temperature Range | Operating: -40°C +85°C Storage : Preferably below +25°C, not exceeding +40°C | [Environmental classification 40/85/56 IEC-68] | | | | |
| Rated Voltage Range (V _r) from 16V to 500V DC | | | | | | |
| Surge Voltage (V _p) | V _p = 1.05 V _r (V _r > 450V DC) V _p = 1.15 V _r (V _r ≤ 250V DC) V _p = 1.10 V _r (V _r > 250V DC) | | | | | |
| Rated Capacitance Range from 68 μF to 33,000 μF | | | | | | |
| Capacitance Tolerance | ±20% at 100 Hz, 20°C [M class IEC-62] | | | | | |
| Leakage Current (I _L) (mA, 5 min, 20°C) | max I _L = 0.006 C _r V _r + 4 μA Kendeil product limit : I _L = 0.003 C _r V _r At 85°C max I _L = 0.04 C _r V _r μA | | | | | |
| Ripple current (I _r) | Refer to table at 85°C and 100Hz For different temperature and frequency multiplier must be used as follows: | | | | | |
| | FREQUENCY | 50Hz | 100Hz | 500 Hz | 1000Hz | >10kHz |
| | MULTIPLIER (0-25V V _r DC) | 0.91 | 1.0 | 1.15 | 1.15 | 1.2 |
| | MULTIPLIER (40-100V V _r DC) | 0.88 | 1.0 | 1.35 | 1.40 | 1.45 |
| | MULTIPLIER (160-450V V _r DC) | 0.88 | 1.0 | 1.45 | 1.50 | 1.55 |
| | AMBIENT TEMP. | 35°C | 45°C | 55°C | 65°C | 75°C |
| | MULTIPLIER | 2.2 | 2.1 | 1.8 | 1.6 | 1.4 |
| | Maximum internal temperature | 98°C | | | | |
| Insulation Resistance | At 100V DC for 1 min is >100 MΩ across insulating sleeve and terminals. | | | | | |
| Vibration Resistance | Frequency range: 10 Hz to 500 Hz, amplitude 0.75 mm max acceleration 10g for 3x2 h | | | | | |
| Life test | After 2,000 hours application of rated voltage at 85°C capacitors meet characteristics aside | Cap change ≤ 20% tan δ ≤ 200% Leakage current (I _L) < initial limit Impedance (Z) ≤ 200% | | | | |
| Shelf life | After leaving capacitors under no load for 500 hours at 85°C, when restored at 20°C meet specifications aside | Cap change ≤ ±15% tan δ ≤ 150% Leakage current (I _L) < initial limit | | | | |
| Useful life | > 200,000 h at 40°C > 5,000 h at 85°C | | | | | |
| Failure percentage | ≤ 1% (during useful life) | | | | | |
| Failure rate | ≤ 25 fit (25 10 ⁻⁹ /h) (V _r ≤ 160V DC) ≤ 33 fit (33 10 ⁻⁹ /h) (V _r > 160V DC) | | | | | |
| Self inductance | Approx. 20 nH | | | | | |
| Reference standards | CECC 30.301 - IEC 60384-4 LONG LIFE GRADE | | | | | |

PLEASE TO CONTACT OUR TECHNICAL SERVICE FOR MORE INFORMATION OR SPEC-IN ANALYSIS.

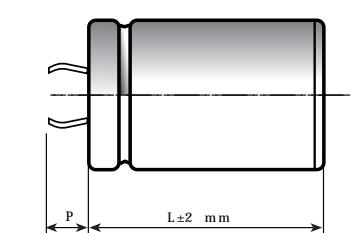

- High temperature 105 °C
- Surge-proof capacitor in aluminium can with insulation sleeve.
- Safety vent at bottom case or aside case.
- Snap in terminals for PCB mounting.
- 2-4 pins available (d=45mm: 4 pins only)
- Large size snap in

APPLICATIONS

Professional switch mode power supplies. Professional power electronics.

Dimensions in mm.

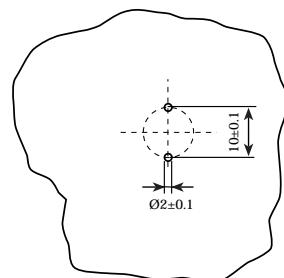

2 PIN CAPACITOR

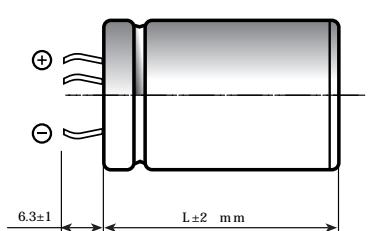

PIN LENGTH

P 4.5 short pin
P 6.3 long pin (standard)

- Surge-proof capacitor in aluminium can with insulation sleeve
- Snap in terminals for PCB mounting.
- Design optimized for high ripple current applications

APPLICATIONS

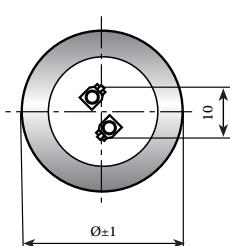

Designed for professional application. Ultra compact UPS, Solar inverters, High ripple current converters, Motor drives.

Dimensions in mm.

SPECIFICATIONS

| | | |
|--|---|---|
| Temperature Range | Operating: -40°C +85°C Storage : Preferably below +25°C, not exceeding +40°C | [Environmental classification 40/85/56 IEC-68] |
| Rated Voltage Range (V _r) from 400V to 450V DC | | |
| Surge Voltage (V _p) | V _p = 1.10 V _r | |
| Rated Capacitance Range from 1000 μF to 2700 μF | | |
| Capacitance Tolerance | ±20% at 100 Hz, 20°C [M class IEC-62] on request: -10% +30% at 100 Hz, 20°C [Q class IEC-62] | |
| Leakage Current (I _L) (mA, 5 min, 20°C) | max I _L = 0.006 C _r V _r + 4 μA At 85°C max I _L = 0.04 C _r V _r μA | Kendeil product limit: I _L = 0.003 C _r V _r |
| Ripple current (I _r) | Refer to table at 85°C and 100Hz: | |
| | FREQUENCY 50Hz MULTIPLIER 0.88 | 100Hz 1.0 500 Hz 1.45 1000Hz 1.50 >10kHz 1.55 |
| | AMBIENT TEMP. 35°C MULTIPLIER 2.2 | 45°C 2.1 55°C 1.8 65°C 1.6 75°C 1.4 85°C 1.0 95°C 0.5 |
| | Maximum internal temperature | 98°C |
| Insulation Resistance | At 100V DC for 1 min is >100 MΩ across insulating sleeve and terminals. | |
| Vibration Resistance | Frequency range: 10 Hz to 500 Hz, amplitude 0.75 mm max acceleration 10g for 3x2 h | |
| Life test | After 2,000 hours application of rated voltage at 85°C capacitors meet characteristics aside | Cap change ≤ 20% tan δ ≤ 200% Leakage current (I _L) < initial limit Impedance (Z) ≤ 200% |
| Shelf life | After leaving capacitors under no load for 500 hours at 85°C when restored at 20°C meet specifications aside | Cap change ≤ ±15% tan δ ≤ 150% Leakage current (I _L) < initial limit |
| Useful life | > 200000 h at 40°C > 6000 h at 85°C (> 12000h at 85°C under testing) | |
| Failure percentage | ≤ 1% (during useful life) | |
| Failure rate | ≤ 33 fit (33 10 ⁻⁹ /h) | |
| Self inductance | Approx. 20 nH | |
| Reference standards | CECC 30.300 - IEC 60384-4 LONG LIFE GRADE | |

K13 TYPE MOTOR START

RoHS Compliant
Directive 2002/95/EC

- Surge-proof electrolytic capacitor in plastic case.
- Poles brought out to single or double fast-on terminals
- Normally supplied with end cup.
- On request: bipolar cable, discharge resistance, metal mounting bracket, with or without cover.

APPLICATIONS

Non polarized capacitor especially designed for intermittent A.C. voltage applications at 50-60 Hz for single phase motor starting.

| | Case | | | Bracket | | |
|----|---------------|----------|-----------|-------------|----------|--------------|
| | Ø est. mm. | L mm. | L1 mm. | Lmax mm. | A mm. | B x C mm. |
| B2 | 46 | 85.7 | 98.4 | 104 | 53 | 37 x 6.1 |

SPECIFICATIONS

| | |
|-----------------------------------|---|
| Operating Temperature Range | (Operating) -25°C +75°C (Storage) -40°C +85°C |
| Working Voltage Range | from 125V AC to 320V AC |
| Capacitance Range | from 25 µF to 800 µF |
| Capacitance Tolerance | -0% +25% or ±10% |
| Tan δ (Dissipation loss angle) | Measurement frequency: 100 Hz, temperature 20°C Value shall not exceed 0.10 and shall be calculated as follows: $\tan \delta = W / (V \times I) = (\text{true watts} / \text{apparent watts})$ |
| Capacitance Measurement | Capacitance shall be determined by measuring the current (after 2±3 seconds of energising) through the capacitors at rated voltage and frequency. The capacitance is defined from the following formula: $C = (I \times 10^6) / 2 \pi f V$ C = capacitance in µF I = current in Amperes π = 3.14 constant f = frequency in Hz V = applied AC voltage in Volt |
| Working condition | The standard time rating defined of the IEC 252 is 1.67% or 1/60 th full time and corresponds to a duty cycle of 3 seconds on and 177 seconds off. Alternative customer duty is available on request. |
| Endurance test | 500 hours |
| Reference standards | VDE 560 - 8 IEC 252 |

MOUNTING HARDWARE

During normal operation electrolytic capacitors are subjected to an internal generation of gas due to heating combined with the inside pressure. Therefore a safety vent is provided to prevent catastrophic failure

Kendeil aluminium electrolytic capacitors screw terminals type have been provided with a safety vent plug on the deck, a tiny rubber capsule designed to support a critical bursting pressure up to 8 bar. To fix these capacitors use the appropriate mounting clamps furnished in different diameter size

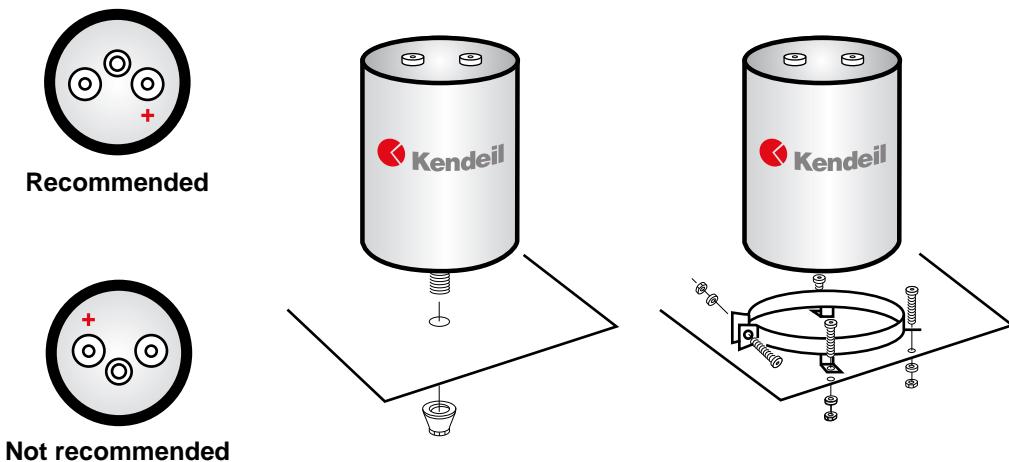

Kendeil aluminium electrolytic capacitors snap in terminals type do have a kind of vent, realized as a weakened area in the base of the alum can, sometimes also by side, that will release the possible growth of excess pressure. Usually board mounted type are easily fixed by their own terminals, and so no special mounting hardware is then required.

When mounting the capacitor, it should be borne in mind that in the event of the vent being blown under failure conditions, a small quantity of hot conductive electrolyte and vapours can, in some cases, flow out from the vent, so the position is important and the can should be carefully located. If possible, we recommend that capacitors are mounted with the safety vent uppermost.

In any case, screws terminal capacitors can be mounted in any position so long as the vent is free to operate.

The overall characteristic parameters such as capacitance, ESR, currents, etc. remain the same whatever is the orientation, but once the vent has been blown, an eventual overflow of electrolyte could damage importants parts of the circuit.

Lastly, a good cooling system must be designed. Consideration must be given as to where to place the circuits especially when dealing with high ripple currents; the area around electrolytic capacitors should be well aired with enough distance between the radiant elements, both for maintenance and for security reasons.

Notes when mounting a screw type capacitors:

Special attention has to be applied during assembling in case of stud capacitors. The threaded stud termination (M8 or M12 diameter) is the bottom part of capacitor's can and it's in electrical contact with negative end termination of capacitor. Please use our plastic nut and plastic ring or other well protected system in order to avoid short circuit between stud and assembling frame.

Can and stud are in electrical contact with negative end termination. Can is covered by sleeve, designed to prevent accidental short circuit during maintenances or assembling operation. Air gap between capacitors and machinery's electrical parts, active parts or machinery's frame has to be taken into consideration for good insulation as defined to many standards of machines.

GENERAL WARNING

Information and data contained in the section "Technical Information" must be considered as a completing part of each family type of capacitor.

Before using a Kendeil capacitor in any application, please read carefully the related specifications included in the catalogue.

An improper installation or not respecting parameters limits might cause damage to the components, their characteristics modification and a decrease of their reliability and useful life.

Products manufactured by Kendeil are made with maximum care, in order to result free of defects in design, materials and workmanship, according with adequate specifications and international standard requirements.

DISCLAIMER

Cooperation between Customers and Kendeil is basically precious in order to solve problems or when a failure occurs. In case of complaint you might have, please forward the following information along with an immediate communication of the failure.

Only upon previous agreement with Kendeil, you could send a detailed description of failure, indicating operative condition and type of application, number of defective pieces, eventually expressed in percent on whole quantity used. It is mandatory to know the original batch of goods as printed on the capacitor sleeve or labeled on the box, also let us know the delivery date and others relevant data from the billing documents. Samples of defective products should be sent to Kendeil for analysis, packed in order to prevent additional damages different from the ones detected.

Data sheets specifications are referred to a fairly large number of components and do not constitute a guarantee of characteristics or properties in the legal sense.

However, agreement on these specifications does not mean that the Customer may not claim for replacement of individual defective capacitors within the terms of delivery; Kendeil will not assume any further liability beyond the replacement of defective capacitors. This applies in particular to any further consequences of component failure as better specified further in this section.

A single failure among a delivered batch of capacitors should not be meaningful of poor reliability of the whole production batch, but should be understood to have reached incidentally the end of life within the failure rate defined for each series type.

NO LIABILITY FOR CONSEQUENTIAL DAMAGES

Kendeil liability shall be limited to only replacement or repairing of goods, free of charge, after aknowledge of received notification by customer.

Kendeil is not responsible for any possible damage to persons or things, of any kind, derived from improper installation, use of application of its products.

Also, the producer shall not be liable for any defect due to accident, fair wear and tear, negligent use, tampering, improper handling and shipment, operation and storage or any other default on the parts of any person other than Kendeil srl.

In customer applications requiring a very high level of operational safety and especially in customer applications in which the malfunction or failure of a passive electronic component could endanger human life or health (e.g. in accident prevention of life-saving systems), it must therefore be ensured by means of suitable design of the customer application or other action taken by the customer (e.g. installation of protective circuitry or redundancy) that no injury or damage is sustained by third parties in the event of malfunction or failure of a passive electronic component.

Any warnings, cautions and product specific notes must be observed.

To the maximum extent permitted by above statements, in no event shall Kendeil or its referred dealers be liable for any damages whatsoever (including without limitation, special, incidental, consequential, or indirect damages for personal injury, loss of business profits, business interruption or any pecuniary loss) arising out of the use or inability to use Kendeil products.

In the case of any product liability claim from third parties against Kendeil srl, not falling within Kendeil liability, Customer or Buyer should hold Kendeil harmless.

COPYRIGHT INFORMATION

Copying of text and images in whole or in part of this catalogue is forbidden without previous written authorization of Kendeil srl. Anyhow brief sentences and abstracts are allowed free for technical articles on specialized publications.
